## I . Life expectancies at specified ages

In the abridged life tables 2016, life expectancy at birth was 80.98 years for males, increasing by 0.23 from 80.75 in 2015, and 87.14 for females, increasing by 0.15 from 86.99.

The difference in life expectancy at birth between males and females was 6.16 years, decreasing by 0.08 years from 2015 to 2016.

Life expectancies at specified ages increased for both males and females from 2015 to 2016.

**Table 1. Life expectancies at specified ages**

Age	Male			Female		
	2016	2015	Increase	2016	2015	Increase
0	80.98	80.75	0.23	87.14	86.99	0.15
5	76.20	75.98	0.22	82.37	82.20	0.17
10	71.23	71.02	0.21	77.39	77.23	0.16
15	66.26	66.05	0.21	72.42	72.26	0.16
20	61.34	61.13	0.21	67.46	67.31	0.15
25	56.49	56.28	0.21	62.53	62.37	0.16
30	51.63	51.43	0.20	57.61	57.45	0.16
35	46.78	46.58	0.20	52.69	52.55	0.14

90	4.28	4.27	0.01	5.62	5.56	0.06

Notes: 1. Data of 2015 were based on complete life tables.

**Table 2. Trend of life expectancies at birth**

Year	Male	Female	Difference
1947	50.06	53.96	3.90
1950-1952	59.57	62.97	3.40
1955	63.60	67.75	4.15
1960	65.32	70.19	4.87
1965	67.74	72.92	5.18
1970	69.31	74.66	5.35
1975	71.73	76.89	5.16
1980	73.35	78.76	5.41
1985	74.78	80.48	5.70
1990	75.92	81.90	5.98
1995	76.38	82.85	6.47
2000	77.72	84.60	6.88
2005	78.56	85.52	6.96
2010	79.55	86.30	6.75
2015	80.75	86.99	6.24
2016	80.98	87.14	6.16

Notes: 1. Data of 1947-2015 were based on complete life tables.

2. Before 1970, data of Okinawa prefecture were not included.

## II. Survivorship in the life tables

In the abridged life tables 2016, the number of survivors at age 65 was 89,083 for males per 100,000 hypothetical cohort and 94,301 for females. This means that the survival rate at age 65 was 89.1% for males and 94.3% for females. In the same way, it followed that the survival rate at age 75 was 75.1% for males and 87.8% for females, and the survival rate at age 90 was 25.6% for males and 49.9% for females.

The median length of life, which means the age when exactly half of the cohort remains alive, was 83.98 years for males and 89.97 years for females, which was 3.00 years longer than the life expectancy for males and 2.83 years for females.

**Table 3. Trend of survival rate at specified ages**

(%)

Year	Male					Female				
	Age 40	65	75	90	95	Age 40	65	75	90	95

2010	82.60	79.55	3.05	89.17	86.30	2.87
2015	83.76	80.75	3.01	89.79	86.99	2.80
2016	83.98	80.98	3.00	89.97	87.14	2.83

Notes: 1. Data of 1947-2015 were based on complete life tables.

2. Before 1970, data of Okinawa prefecture were not included.

### III. Life expectancies at birth in some countries

In general, it is rather difficult to compare life expectancies accurately among different countries. One of the reasons is the periods based on are not always accordant with each other.

Next table provides the life expectancies at birth in some countries as far as we have obtained.

**Table 5. Life expectancies at birth in some countries**

(Life expectancy : years, Population : 10 thousands)

Country	Period	Male	Female	Population	
Japan	2016*	80.98	87.14	12 502

	New Zealand	2014 – 2016*	79.91	83.40	460

Reference: \*In Hong Kong of 2016, life expectancy at birth for males was 81.32 years and that for females was 87.34 years.  
(Population: 731 ten thousands)

Note: Population in this table means mid-year estimated population in 2015 (in cases of South Africa, Bangladesh, Israel, Qatar and Thailand 2014, Russian Federation 2013, India 2012).

On the other hand, population of Japan was estimated population at Oct.1, 2016.

#### IV. Analysis by cause of death

##### 1. Mortality probability by cause of death

Mortality probability by cause of death means the probability that a person of a given age will die from a specific cause of death in the future according to the life tables.

As for leading causes of death in 2016, the mortality probability by malignant neoplasms was the highest for both males and females at age 0, followed by heart diseases, pneumonia and cerebrovascular diseases. Comparing data between age 0 and 65, the mortality probability was lower at age 65 than at age 0 for malignant neoplasms. And for the other three leading causes it was higher at age 65. This trend was more likely observed at age 75. On the other hand, for cerebrovascular diseases, the mortality probability was lower at age 90 than at age 75 for both males and females.

The total of the mortality probabilities by malignant neoplasms, heart diseases and cerebrovascular diseases was over 50 percent at age 0 and 65 for male, however under 50 percent at all the ages for females.

**Table 6. Mortality probability by causes of death, 2016**

Cause of death	Age 0		Age 65		Age 75		Age 90	
	Male	Female	Male	Female	Male	Female	Male	Female
Malignant neoplasms	29.14	20.35	28.72	18.59	25.49	16.39	15.53	9.80
Heart diseases	14.21	17.12	14.29	17.74	14.58	18.23	16.25	19.03
Cerebrovascular diseases	7.79	8.98	7.87	9.14	8.05	9.31	7.52	9.17

## 2. Potential years of life lost

If a certain cause of death was eliminated, a person who had died from the cause would die from another cause after he or she originally had died. As a result, life expectancy would be extended. This extended period of life time, which is called the potential years of life lost, can be regarded as one's life lost by the cause of death, and it enables us to estimate how much the cause affects life expectancy.

In 2016, the potential years of life lost by malignant neoplasms were the longest at age 0 for both males and females, followed by heart diseases, pneumonia and cerebrovascular diseases for males, and, heart diseases, cerebrovascular diseases and pneumonia for females. The order was also the same at age 65. In the same way, the order of the four causes at age 75 was malignant neoplasms, heart diseases, pneumonia and cerebrovascular diseases for males, and malignant neoplasms, heart diseases, then cerebrovascular diseases and pneumonia at the same year for females. However, some causes changed ranks at age 90: heart diseases and pneumonia at the same year, malignant neoplasms and cerebrovascular diseases for males, and heart diseases, pneumonia, malignant neoplasms and cerebrovascular diseases for females.

Potential years of life lost by malignant neoplasms, heart diseases and cerebrovascular diseases was 6.95 years for males and 5.74 years for females at age 0, 5.61 years for males and 4.60 years for females at age 65, 4.18 years for males and 3.78 years for females at age 75, 1.76 years for males and 1.95 years for females at age 90.

**Table 7. Potential years of life lost, 2016**

Cause of death	(years)							
	Age 0		Age 65		Age 75		Age 90	
	Male	Female	Male	Female	Male	Female	Male	Female
